Stroke Delivery Network

Cognitive Communication Disorder:

When a person has trouble with thinking skills that impact upon language and conversation

Dysphasia (or Aphasia):

When a person has difficulty understanding or expressing language using speech or writing

Verbal Dyspraxia:

Is the lack of ability to sequence and co-ordinate the muscle movements involved in speech

Dysarthria:

Is caused by the muscles involved in speech production no longer being able to work as strongly, quickly and accurately as before

Dysfluency:

When a person has difficulty in producing smooth, fluent speech (may sound like a stammer)

Dysphonia:

When a person has changes to the sound of the voice

Changes to social communication skills:

when a person has trouble following the rules of conversation e.g. turn-taking

Stages of Communication:

- 1 Focussed attention
- 2 Hear it
- 3 Remember it
- 4 Understand it
- 5 Think of an answer (formulate an idea)
- 6 Find the words
- 7 String them together correctly (in your mind)
- 8 Coordinate the muscle movements (in your mouth & lips)
- 9 Articulate (say) the words (response)
